

ANSHUMAN MOHAPATRA

Cloud & DevOps Engineer (AWS | Serverless | Infrastructure as Code)

[GitHub](#) | [Email](#) | +91 7978294262 | [Portfolio](#) | [LinkedIn](#)

Cloud & DevOps Engineer with hands-on experience designing production-oriented serverless systems on AWS using Infrastructure as Code, event-driven architecture, and scalable backend design. Selected as **Team Lead** at F13 Technologies for demonstrating ownership and architectural thinking. I approach cloud engineering by translating business requirements into secure, scalable cloud solutions before selecting AWS services.

EXPERIENCE

AWS Cloud Engineer Intern (Team Lead) – F13 Technologies – Remote

Sep 2025 – Dec 2025

- Selected as **Team Lead** after demonstrating strong cloud architecture, ownership, and delivery during internship training
- Led a team to architect and deploy **production-grade serverless applications** on AWS, improving delivery speed by **40%** through structured task breakdown and clear ownership
- Designed and delivered **multiple production-grade serverless systems** — spanning secure storage, AI-powered pipelines, analytics platforms, and URL management — all built to scale
- Coordinated parallel workstreams across team members, ensuring alignment on architecture decisions and on-time delivery of scalable, cost-efficient systems

TECHNICAL SKILLS

AWS: Lambda, API Gateway, EventBridge, DynamoDB, S3, Cognito, SES, CloudWatch, IAM, VPC, Route53, Textract, EC2, ECS, EKS

IaC & DevOps: CloudFormation, Terraform, AWS CDK, Docker, Kubernetes, GitHub Actions, Jenkins

Monitoring: CloudWatch, Prometheus, Grafana, ELK Stack | **Networking & Security:** VPC, IAM, DNS, SSL/TLS, NAT

Programming: Python, Bash, JavaScript, Java, C++ | **Core:** Serverless & event-driven architecture, CI/CD, Linux, Git

PROJECTS

[EventSphere — Production-Grade Event-Driven Serverless Platform](#)

[\[Live site\]](#)

- Designed a production-oriented serverless Event Ticketing platform by translating business capabilities into domain-driven cloud architecture, deriving REST APIs, DynamoDB access patterns, and **event-driven workflows** before selecting AWS services.
- Modeled Events, Registrations, and Tickets around application access patterns, designing optimized partition keys and **9 Global Secondary Indexes** to enable efficient queries without table scans.
- Architected an asynchronous registration-to-ticket workflow using **Amazon EventBridge**, decoupling attendee registration from **SVG ticket generation**, Amazon S3 storage, and **Amazon SES** delivery while improving modularity and future extensibility.
- Implemented **Cognito JWT authentication**, **role-based authorization**, **least-privilege IAM** policies, and modular **Terraform** infrastructure for secure, reproducible cloud deployments.

[LinkForge Pro – Serverless URL Shortener & Analytics Platform](#)

[\[Live site\]](#) | [\[Admin Panel\]](#)

- Designed a serverless URL shortener by modeling URL creation, redirection, and analytics as independent cloud services; deployed end-to-end using CloudFormation.
- Designed DynamoDB schema with hash-key lookups and atomic click-count increments; scales to millions of requests with zero capacity planning
- Built 3 scoped Lambda functions behind HTTP API Gateway with input validation, CORS, and least-privilege IAM roles per function
- On-demand billing auto-scales at 10X traffic with no throttling — cost stays **~\$1.50–3/month** at 1M redirects; point-in-time recovery enabled
- Secured via pre-signed URLs and origin-restricted CORS; zero AWS credentials exposed to frontend at any layer

[Cloud-Native Resume Processing & Candidate Matching Platform](#)

[\[Live site\]](#)

- Designed a four-stage event-driven document processing pipeline — S3 upload → Textract → skill parser → job matcher — automated via S3 event triggers and DynamoDB streams
- Integrated AWS Textract achieving **~99% extraction accuracy**; skill engine scores candidates against job descriptions with real-time gap analysis
- Deployed 6 Lambda functions with shared Lambda Layer; processed 9 real candidates across 10+ jobs generating 100+ match records in live testing
- At 10X traffic, each Lambda scales concurrently — 100 parallel uploads trigger 100 parallel Textract calls with no throttling
- Delivered **99% cost reduction** vs. manual screening (**~\$0.01/resume** vs. \$2.50–8.33); IAM roles scoped per function; pre-signed S3 URLs, no direct bucket exposure

[Serverless Media Processing Platform](#)

[\[Live site\]](#)

- Designed an event-driven image processing pipeline triggered by Amazon S3 uploads; auto-generates 1080p/720p/480p versions with **90–98% file size reduction** (14.4MB → 222KB verified)
- Provisioned all infrastructure (**3 S3 buckets, 3 Lambda functions, IAM, API Gateway**) via **Terraform** — 30 resources, reduced redeployment from 21 min to 6 min
- Pre-signed S3 URLs with TTL; least-privilege IAM per Lambda; zero credentials on frontend; **\$0 Free Tier** cost — **~\$3.15/month** at 10K images vs. \$30–80+/month for EC2

EDUCATION

B.Tech – Computer Science Engineering
ITER, SOA University

2022 – Present
