

ANSHUMAN MOHAPATRA

Cloud & DevOps Engineer (AWS | Terraform | Kubernetes | CI/CD)

[GitHub](#) | [Email](#) | +91 7978294262 | [Portfolio](#) | [LinkedIn](#)

Cloud & DevOps Engineer with experience designing and deploying AWS-based cloud systems using Infrastructure as Code, serverless and event-driven architecture, and DevOps automation. Selected as Team Lead at F13 Technologies for demonstrating ownership and architectural thinking. I approach cloud engineering by translating business requirements into secure, scalable cloud solutions before selecting AWS services.

EXPERIENCE

AWS Cloud Engineer Intern (Team Lead) – F13 Technologies – Remote

Sep 2025 – Dec 2025

- Selected as **Team Lead** after demonstrating strong cloud architecture, ownership, and delivery during internship training
- Led a team to architect and deploy **production-grade serverless applications** on AWS, improving delivery speed by **40%** through structured task breakdown and clear ownership
- Designed and delivered **multiple production-grade serverless systems** — spanning secure storage, AI-powered pipelines, analytics platforms, and URL management — all built to scale
- Coordinated parallel workflows across team members, ensuring alignment on architecture decisions and on-time delivery of scalable, cost-efficient systems

TECHNICAL SKILLS

AWS: Lambda, API Gateway, EventBridge, DynamoDB, S3, Cognito, SES, CloudWatch, IAM, VPC, Route53, Textract, EC2, ECS, EKS

IaC & DevOps: Terraform, CloudFormation, AWS CDK, Docker, Kubernetes, GitHub Actions, Jenkins

Monitoring & Observability: CloudWatch, Prometheus, Grafana

Networking & Security: VPC, IAM, DNS, SSL/TLS, NAT

Programming: Python, Bash, JavaScript, Java, C++ | **Core:** Serverless & event-driven architecture, CI/CD, Linux, Git

PROJECTS

[Operations ERP — Production-Grade AWS Container Platform](#)

[\[Live site\]](#)

- Designed and deployed a production-oriented operations platform on **AWS ECS Fargate**, using **ALB, RDS PostgreSQL, ECR, VPC, SSM, CloudWatch**, and **Terraform** for reproducible infrastructure.
- Built **Dockerized frontend/backend services** with a **5-stage GitLab CI/CD pipeline** for validation, testing, container build, packaging, and automated AWS deployment.
- Implemented secure JWT/RBAC authentication, **least-privilege IAM**, transactional inventory operations, and concurrency-safe stock reservation using PostgreSQL row locking; verified with **74 automated tests**.

[EventSphere — Production-Grade Event-Driven Serverless Platform](#)

[\[Live site\]](#)

- Designed a production-oriented serverless ticketing platform from business requirements, using domain-driven architecture, REST APIs, DynamoDB access patterns, and event-driven workflows.
- Modeled Events, Registrations, and Tickets with optimized partition keys and **9 Global Secondary Indexes** for efficient queries without table scans.
- Built an asynchronous registration workflow with **Amazon EventBridge**, decoupling registration from **SVG ticket generation**, S3 storage, and **Amazon SES** delivery.
- Implemented **Cognito JWT authentication**, **role-based authorization**, **least-privilege IAM**, and modular **Terraform** infrastructure for secure, reproducible deployments.

[LinkForge Pro – Serverless URL Shortener & Analytics Platform](#)

[\[Live site\]](#) | [\[Admin Panel\]](#)

- Designed a serverless URL-shortening and analytics platform with independent services for link creation, redirection, and analytics, deployed using **AWS CloudFormation**.
- Designed DynamoDB access patterns with hash-key lookups and atomic click tracking for scalable, high-throughput reads and writes.
- Built 3 scoped Lambda functions behind HTTP API Gateway with input validation, CORS, and least-privilege IAM roles.
- Enabled on-demand scaling to **10X traffic** without throttling; estimated cost at **~\$1.50–3/month** for 1M redirects with point-in-time recovery.
- Secured frontend access using pre-signed URLs and origin-restricted CORS, with **no AWS credentials exposed** to the frontend.

[Cloud-Native Resume Processing & Candidate Matching Platform](#)

[\[Live site\]](#)

- Designed a four-stage event-driven pipeline: S3 upload → Textract → skill parser → job matcher, automated through S3 events and DynamoDB Streams.
- Integrated AWS Textract with **~99% extraction accuracy** and built real-time candidate-to-job skill gap analysis.
- Deployed 6 Lambda functions with a shared Lambda Layer; processed **9 real candidates across 10+ jobs**, generating 100+ match records in live testing.
- Designed for concurrent scaling, supporting **100 parallel uploads** without throttling and achieving an estimated **99% cost reduction** versus manual screening.

EDUCATION

B.Tech – Computer Science Engineering
ITER, SOA University

2022 – 2026
